Abstract

A process for the production of L-lysine, comprising:

5

- a) fermentation of the L-lysine producing coryneform bacteria that are at least sensitive to diaminopimelic acid analogues, in particular 4-hydroxydiaminopimelic acid;
- b) enrichment of the L-lysine in the medium or in the bacterial cells; and optionally
- a) c) isolation of the L-lysine or L-lysine-containing feedstuffs additive from the fermentation broth, so that ≥ 0 to 100% of the constituents from the fermentation broth and/or from the biomass are present,
- and optionally bacteria are used in which in addition

 15 further genes of the biosynthesis pathway of L-lysine are
 enhanced, or bacteria are used in which the metabolic
 pathways that reduce the formation of L-lysine are at least
 partially switched off.
